DETAILED ACTION

1. This Office Action is responsive to the Amendment filed 14 June 2007. Claims 20-29 and 32-68 are now pending, while claims 24-29, 35, 36, 46-52 and 57-61 remain withdrawn from consideration. The Examiner acknowledges the amendments to claims 20, 22-23, and 41, as well as the cancellation of claims 30-31 and the addition of claims 62-68.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.
- 3. Claims 20-23, 32-34, 37, 39-43, 45, 53-54, 56, and 65 are rejected under 35 U.S.C. 102(e) as being anticipated by Paolitto et al. (U.S. Pub. No. 2003/0010346). Paolitto et al. (hereinafter Paolitto) teach a surgical apparatus and procedure for performing surgery on a beating heart via percutaneous approach. Regarding claims 20-23, 40-43, 45, 53-54, 56 and 65, Paolitto discloses a heart stabilizing device 20 and a heart positioning device 30. A tissue retractor 40 provides access to the patient's heart through an incision [0102]. Heart stabilizing device 20 engages a surface of the beating heart through suction imposed by a negative pressure source through a barb

Art Unit: 3735

fitting "port" [0106]. It is noted that Paolitto teaches that multiple cannulae may be inserted for access to the thoracic cavity of the patient. For instance, one access cannula may be deployed to access the left pleural space, and another may be deployed to access the right plural space, thus allowing the use of multiple instruments within a first, second and third incision [0195]. A first coupling device and second coupling device are interpreted as cannulae 10 (one provided at two separate incisions) for accessing the thoracic cavity. Each cannula constitutes an elongated shaft (see Fig. 3A) having a proximal end and distal end, with a means for coupling with the heart stabilizing device and heart positioning device. Such a means is collet 182 of cannula 10 (or coupling device) for coupling with either a heart stabilizing device or the heart positioning device [0072]. The coupling device further comprises at least one "flexible, rigidifying portion" interpreted as permanent weir 130. Permanent weir 130 extending around the perimeter of access cannula 10 (or "elongate shaft") is preferably rigid, but may also be made from a more flexible biocompatible polymeric material [0055].

Regarding claims 32-34, a flexible arm **50** couples the first and second coupling devices with at least one stable object, such as surgical table **3** [0058]. The flexible arm enables re-positioning and re-orientation of the cannula or "coupling device" [0064]. The first and second arms are further capable of being "rigidified" after coupling with a stable object via a clamp **570** [0058].

Paolitto teaches a tissue retractor **40** having a frame (see Fig. 4) for movably holding two retractor blades **410** for retracting an incision. A lever **430** engages handle

Art Unit: 3735

461 to "crank" the retractor blades and thus retract the tissue for subsequent access to the patient's interior anatomy, in accordance with claims 37 and 39.

Further regarding claims 41 and 63, an "actuation device," or tightening member 181 can tighten the coupling means 182 to the surgical tool 20 and loosen the coupling means from the surgical tool.

Claim Rejections - 35 USC § 103

- 4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 5. Claim 38 is rejected under 35 U.S.C. 103(a) as being unpatentable over Paolitto et al. (U.S. Pub. No. 2003/0010346) in view of Daniel et al. (U.S. Pub. No. 2002/0068855). Paolitto discloses the invention as claimed, see rejection supra; however Paolitto does not expressly disclose a retracting blade having nerve protection means. Daniel et al. (hereinafter Daniel) teach a system and apparatus for manipulating a tissue structure within a body cavity, such as the heart, by retracting an outer portion enclosing the tissue. Regarding claim 38, Daniel teaches a retractor used with an atraumatic tissue-engaging surface 220, wherein the tissue-engaging surface 220 comprises a rigid plate and a biocompatible elastomeric cushion engaging the heart directly ([0065] and [0069]). Therefore, at the time of the invention it would have been obvious to one having ordinary skill in the art to have fitted a retracting device as taught

Art Unit: 3735

by Paolitto with an elastomeric, biocompatible portion as suggested by Daniel such that the portion of the device engaging the tissue to be retracted imparts as little stress to the heart tissue as possible and protects the anatomy (including that of surrounding nerves) from damage as a result of the invasive nature of the surgical instruments utilized.

6. Claims 44 and 55 are rejected under 35 U.S.C. 103(a) as being unpatentable over Paolitto et al. (U.S. Pub. No. 2003/0010346) in view of Houser et al. (U.S. Pub. No. 2003/0060685). Paolitto discloses the invention as claimed, see rejection supra; however Paolitto does not teach inflating a tissue contacting surface of the heart stabilizing or positioning member. Houser et al. (hereinafter Houser) teach a surgical instrument for contacting and stabilizing tissue of the heart. Regarding claims 44 and 55. Houser teaches a heart stabilizing or positioning member 100 having a tissue contacting surface 120. The contacting section may be configured to provide a variety of atraumatic surfaces, as well as ways to prevent slippage and invoke immobilization of the heart. Houser teaches a member or "port" to supply vacuum, a stream of fluid, or an inflatable medium to abut the contacting section against the surface of the heart [0113]. Furthermore, Houser teaches the introduction of an inflation medium through the same conduit for supplying vacuum, which immobilizes the heart (as in the instant application). Therefore, at the time of the invention it would have been obvious to one having ordinary skill in the art to have provided an inflation medium as suggested by Houser to a heart stabilizing or positioning member as taught by Paolitto such that minimal damage is imparted to the sensitive cardiac tissue.

7. Claims 62, 64 and 66-68 are rejected under 35 U.S.C. 103(a) as being unpatentable over Paolitto et al. (U.S. Pub. No. 2003/0010346) in view of Peng et al. (U.S. Pub. No. 2003/0009080). Paolitto discloses the invention as claimed, see rejection supra; however Paolitto does not expressly disclose a flexible arm coupled with the first coupling device, whereby the flexible arm can be rigidified by applying suction. Peng et al. (hereinafter Peng) teaches an organ manipulator including at least one suction member. Regarding claims 62, 64 and 66, Peng teaches a flexible arm 4 (having both a rigid and flexible state) and a suction line 5 which acts to rigidify the flexible arm 4 [0070]. Paolitto similarly teaches a rigid arm 540 for coupling with the first coupling device [0058]. Furthermore, Peng discloses that multiple arms may be incorporated for positioning the suction member, constituting a "second coupling device" and "second flexible arm" (Fig. 14).

Further regarding claims 66 and 68, Paolitto teaches a retractor device 40, a heart stabilizing device 20 comprising a tissue contacting surface, a suction aperture [0106] and a complementary coupling means 119. A first coupling device 10 comprises an elongate shaft having a proximal and distal end, a distal coupling means 180 that can be tightened or loosened by an actuation device 181 relative to the complementary coupling means 119 ([0073]-[0074]). A first arm 540 is coupled with the first coupling device via a clamp 510 (Fig. 7 and [0058]). Therefore, at the time of the invention it would have been obvious to one having ordinary skill in the art to have provided a rigid arm as taught by Paolitto with flexible properties as suggested by Peng in order to stabilize the suction member on the heart.

Response to Arguments

- 8. Applicant's arguments filed 14 June 2007 with respect to the rejection of claims 20-23, 30-34, 37, 39-43, 45, 53-54 and 56 under 35 U.S.C. 102(e) citing Paolitto et al. (U.S. Pub. No. 2003/0010346) have been fully considered but are moot in view of the new grounds of rejection presented citing Paolitto et al. (U.S. Pub. No. 2003/0010346). However, Applicant contends that Paolitto's permanent weir cannot be rigidified by applying suction. It is submitted that the claim language describes a first coupling device comprising an elongate shaft (cannula 10) and "at least one flexible, rigidifying portion," which is interpreted as permanent weir 30. While Paolitto teaches that permanent weir 30 (the "at least one flexible, rigidifying portion") is preferably rigid, it may also be made from a more flexible biocompatible polymeric material [0055], thus making it capable of being rigidified by applying suction. The rejection has been modified to reflect the amendments in the claims.
- 9. Applicant's arguments filed 14 June 2007 with respect to the rejection of claim 38 under 35 U.S.C. 103(a) citing Paolitto et al. (U.S. Pub. No. 2003/0010346) in view of Daniel (U.S. Pub. No. 2002/0068855) have been fully considered but are moot in view of the new grounds of rejection presented above citing Paolitto et al. (U.S. Pub. No. 2003/0010346) in view of Daniel (U.S. Pub. No. 2002/0068855).

10. Applicant's arguments filed 14 June 2007 with respect to the rejection of claims 44 and 55 under 35 U.S.C. 103(a) citing Paolitto et al. (U.S. Pub. No. 2003/0010346) in view of Houser et al. (U.S. Pub. No. 2003/0060685) have been fully considered but are moot in view of the new grounds of rejection presented above citing Paolitto et al. (U.S. Pub. No. 2003/0010346) in view of Houser et al. (U.S. Pub. No. 2003/0060685).

Page 8

Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, THIS ACTION IS MADE FINAL. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Christine D. Hopkins whose telephone number is (571) 272-9058. The examiner can normally be reached on Monday-Friday, 7 a.m.-3:30 p.m..

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Charles Marmor, II can be reached on (571) 272-4730. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov.
